

WORKSHOP CHOICE

January 21, 2014

We propose a new method to improve the performance of caching in a Cloud infrastructure making use of predictive and adaptive algorithms where content of the cache memory is determined by the solution a stochastic optimization model. The method uses information about the requests and the cloud costs. The objective is to produce an algorithm providing a global optimization of the total operational costs.

Agenda

- 17h00 Welcome
- 17h05 Presentation of work
by Dr Efstratios Rappos and Lionel Schaub
- 18h00 Appetizer

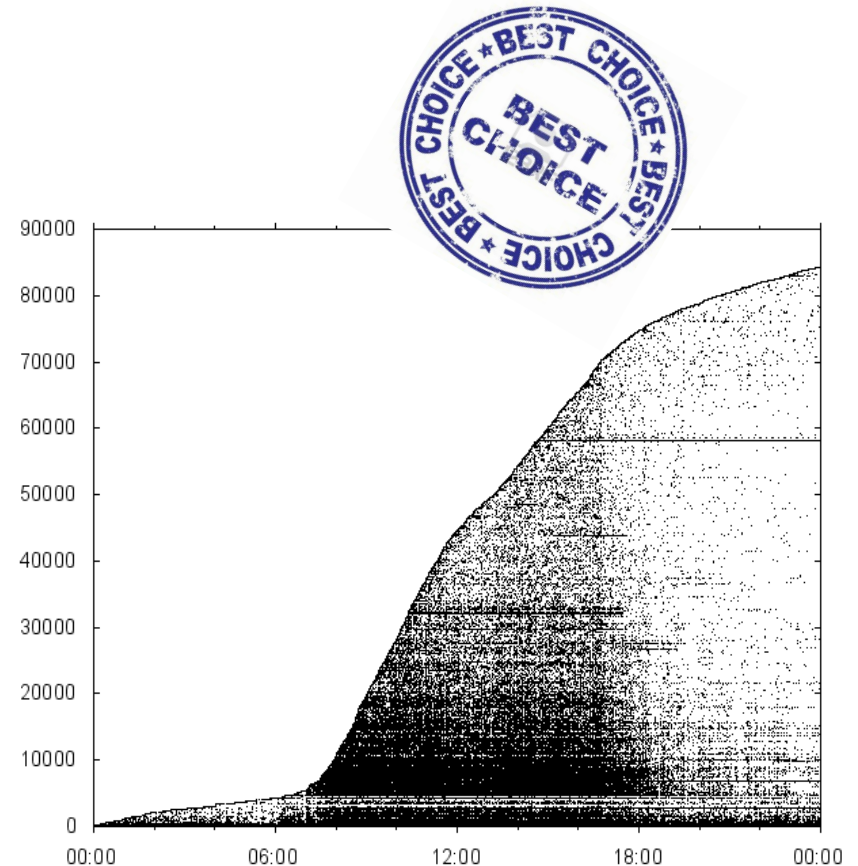

Venue

HEPIA

Room AS01 (Ground floor)
Rue de la Prairie 4
1202 Genève
